                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
The present sequence represents a fusion of an anti-CD20 single chain antibody (B9E9) streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Goshorn SC, Graves

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer, e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              light and heavy chain J regions useful in the design of oligonuclectides (UIGs) for use as primers or probes for cloning immunoglobulinlight or heavy chain mRNAs or genes. Depending on t nature of design of a particular UIG, it may be capable of hybridizing to all Ig mRNAs or genes containing a single specific sequence. UIG denotes universal immunoglobulin gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ITGE-)

The present sequence is the light chain variable region of the 2H7 antibody. The 2H7 cDNA was used in the preparation of a novel polynucleotide molecule encoding an Ig fragment. The DNA molecule comprises 2 DNA sequences encoding 2 pectate lyase secretion signal sequences respectively linked to a DNA sequence encoding an Ig fragment graduence single prokaryotic promoter so as to form a disistronic transcription unit, provided that the Ig fragment can bind an antigen and is produced and secreted by an E. coli host cell. The polynucleotide molecule is expressed in the host cell. The polynucleotide molecule is used for the production of recombinant antibodies, which can be used for passive immunisation without negative immune reactions (e.g. serum sickness and anaphylactic shock), in labelled forms as immunoassay or imaging reagents, in complement mediated lysis and for therapeutic agent.

      A polypeptide (AAW16344) comprises the light chain variable region of mouse monoclonal antibody 2H7, which recognises human B-cell surface antigen Bp35. It is encoded by a CDNA close (AAR70869) obtd. from a 2H7 cDNA library by PCR amplification. The 2H7 heavy chain variable sequence (AAW16343) is also provided. A novel human-mouse chimaeric antibody with specificity for the human B-cell antigen has been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibody engineering; passive immunisation; 2H7; B-cell antigen; F

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the light chain variable region of the 2H7 cm ouse monoclonal antibody. The 2H7 antibody recognises the human B-cell surface antigen Bp35, which plays a role in B-cell activation. This sequence was used in a human-mouse chimeric antibody with human B-cell cantigen specificity, that was produced using the method of the invention. The method of the invention is for the production of a protein in a cantigen specificity, that was produced using the method of the invention. The method improves on current techniques, by cusing a vector including DNA encoding the pectate lyase signal sequence (see AATS1034), attached to the sequence encoding the protein for production. The method is especially used to make immunoglobulins (Ig), carticularly those with a human constant region, suitable for passive communisation (without risk of serum sickness or anaphylaxis) or for in convolin vitro diagnosis and imaging. The Ig may also be used therapeutically, optionally coupled to toxins, etc. Alternatively the cortein to be produced is the sweetener thaumatin. The presence of this signal sequence means that the protein is exported from the cytoplasm can be recovered from the culture medium or periplasm, in active and correctly folded form. The method allows the class of any antibody to be switched, e.g. most human-human Ig are of M class, easily reduced and can be recovered con now be changed to G, A or E classes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                            Q
                                                            В
                                                                                                                                                                                    The present sequence was used in the development of a novel method control for the production of an immunoglobulin (Ig) fragment capable of binding an antigen. The method comprises culturing an E. coli host that has been transformed with a nucleic acid molecule encoding the Ig fragment, under conditions so that the Ig fragment is produced and secreted. The nucleic acid molecule comprises DNA sequence encoding: (a) pectate lyase secretion signal sequence operably linked to a DNA sequence encoding at least the variable region of an Ig Fd molecule; and (b) pectate lyase secretion signal sequence operably linked to a DNA sequence encoding at least the variable region of an Ig Fd molecule; and (b) pectate lyase secretion signal sequence operably linked to a Single prokaryotic promoter to form a dicistronic transcription unit. The method is used to produce chimeric Fab molecules, e.g. derived from murine monoclonal antibody 2H7 raised against human B-cell surface antigen. The invention provides a convel approach for producing genetically engineered antibodies of desired variable region specificity and constant region expression in genetically engineered organisms. The application of chemical gene synthesis, recombinant DNA cloning and production of specific Ig chains in various organisms provides an effective solution for the efficient large scale production of human to the production of the profiles a solution to
                                                                                                                                      Query Match

Result

score and is Pred. No.

d. No. 1s the number of results predicted by chance to have a re greater than or equal to the score of the result being printed. is derived by analysis of the total score distribution.
